

NOTE: Interruption of the firmware upgrade process could corrupt the firmware image making the unit unusable. SoftIron highly recommends performing the process with the unit protected by an uninterruptible power supply.

1. Download the latest firmware image and the firmware flash tool.
2. Copy the firmware .ROM file and SsiFlashARM64.EFI flash tool to either a SD card or the EFI partition on the Overdrive 3000 boot drive.
NOTE: The Overdrive 3000 SD card slot is not compatible with SanDisk cards. Only cards with MMC-over-SPI are supported. This guide was created using a Patriot Memory PSF8GSDHC10-PC card.
3. Shut down the unit.
4. If the files were copied to an SD Card, insert that card in to the SD card slot on the back of the unit.
5. Connect to the serial console port on the rear of the chassis. Bring up a terminal window and power on the unit. The first screen will show the firmware build date:

```
NOTICE: BL3-1:
NOTICE: BL3-1: Built : 18:22:46, Nov 23 2015
INFO:    BL3-1: Initializing runtime services
INFO:    BL3-1: Preparing for EL3 exit to normal world
INFO:    BL3-1: Next image address = 0x8000000000
INFO:    BL3-1: Next image spsr = 0x3c9
Boot firmware (version built at 18:27:24 on Nov 23 2015)
```

6. The next screen also shows the build date as well as the version.

```

```

18. Enable BMC Support.

19. Note that the BMC self test will show as failed after it is first enabled in the BIOS. This is expected behavior as the self test has not been run. It will run automatically on the next power on or restart.

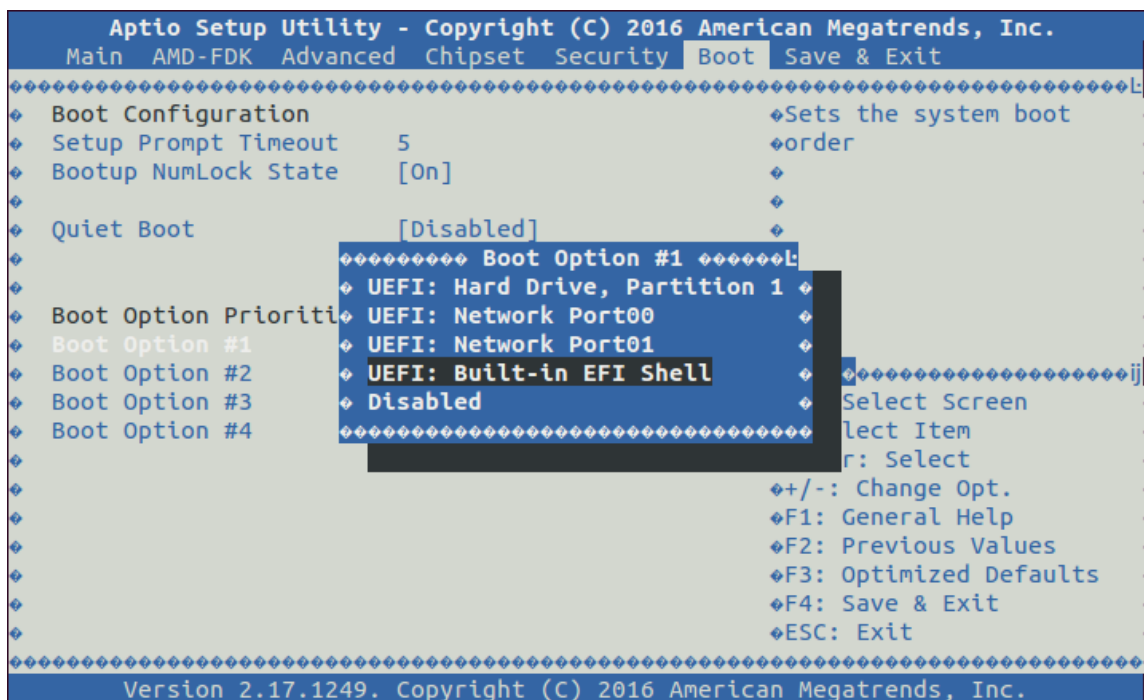

20. Navigate to the Boot tab (left direction arrow twice from the Server Management tab). Move down to the first boot option.

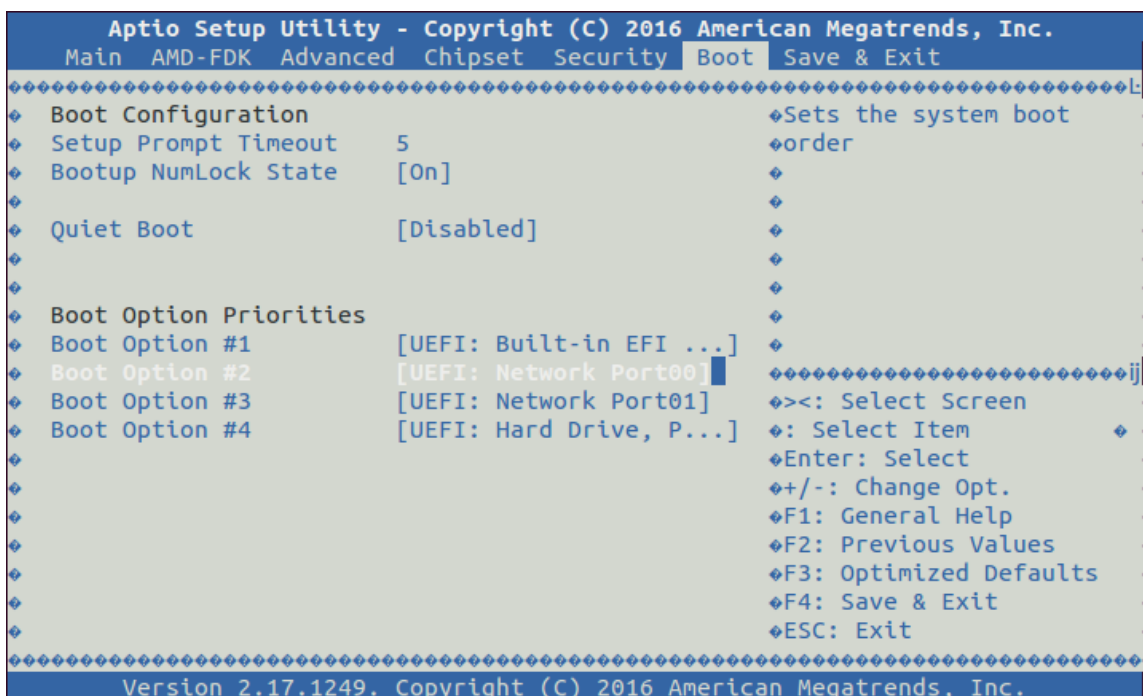

21. Change the first boot option to the Built-in EFI Shell.

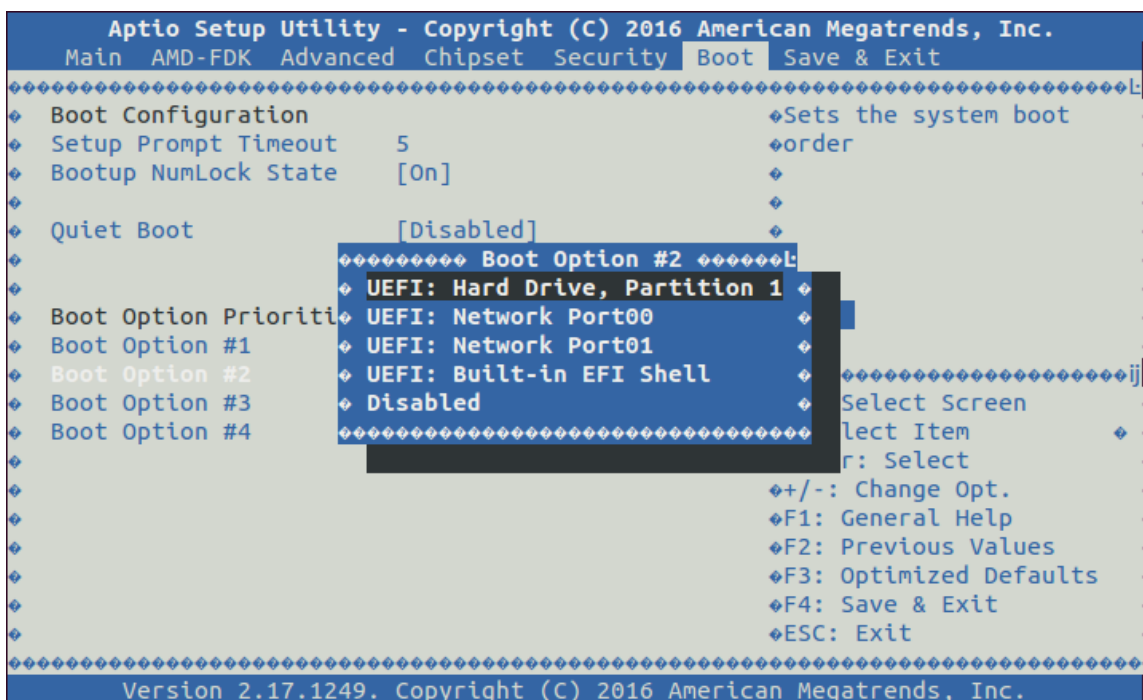

NOTE: The following configuration step is necessary for installations that do not use the PXE boot option. As of firmware 1.0.0.1A there is a known bug that could prevent the operating system from loading properly when the system is connected to certain networks without a PXE boot server. Moving the EFI Shell before the Network Ports in the boot order prevents this bug from causing the OS boot to fail.

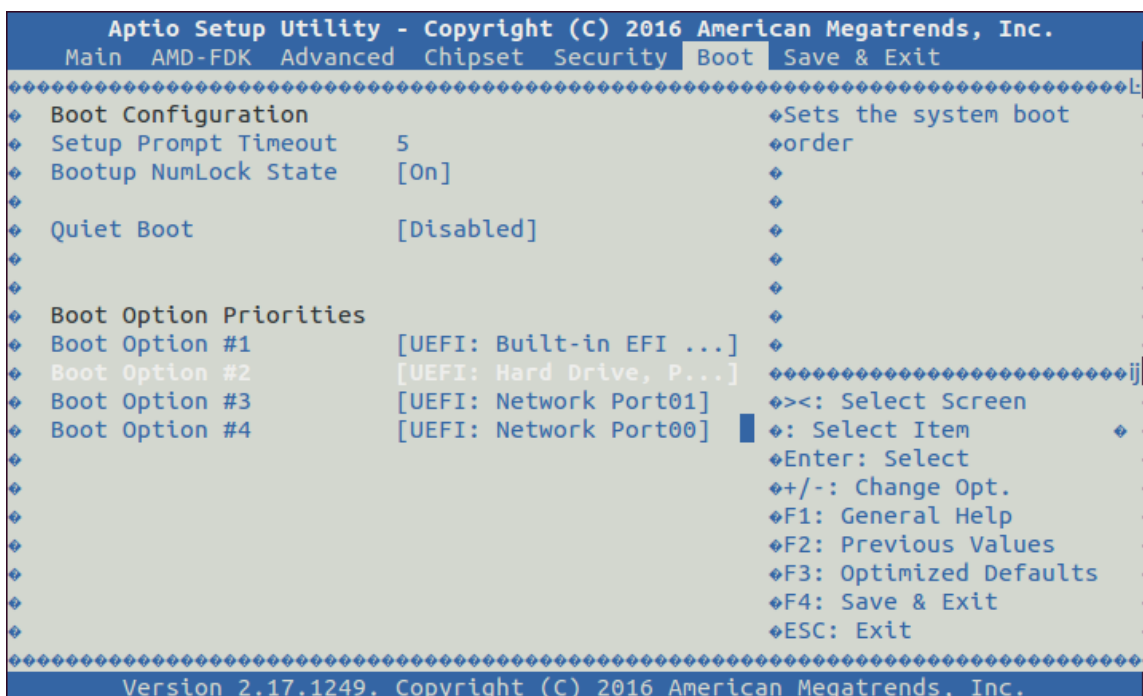

22. Move down to the second boot option.

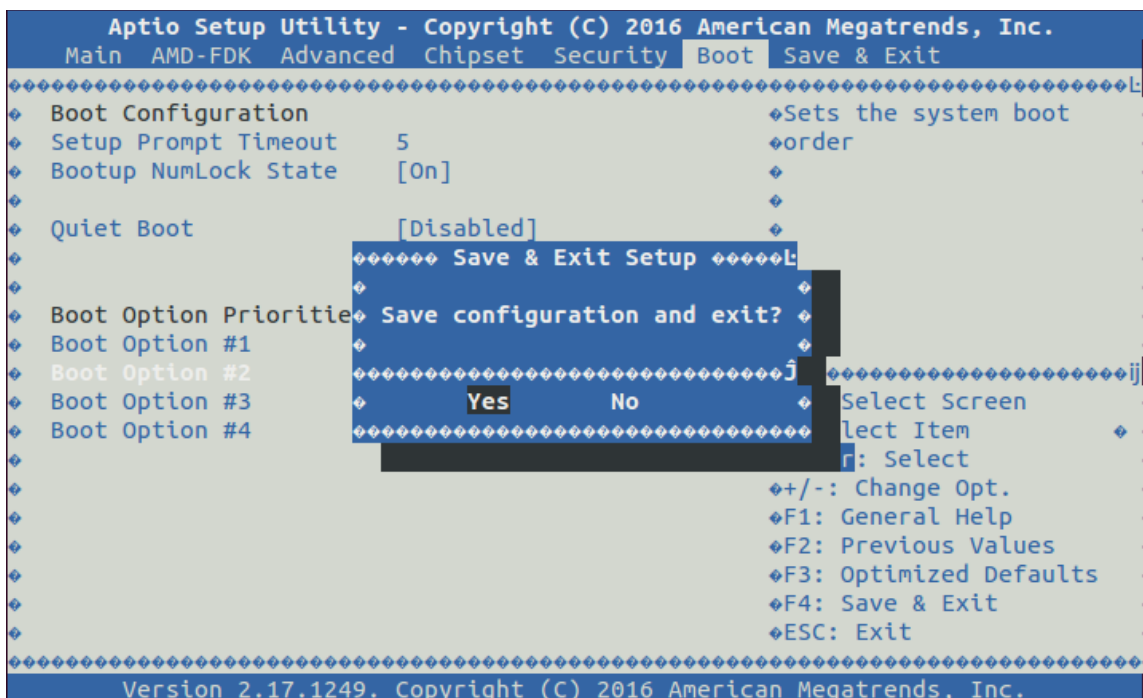

23. Change the second boot option to the hard drive partition that holds the boot OS (Partition 1 in the example below).

24. The completed boot order.

25. Press F4 and then Yes to save the configuration and exit the setup utility.

26. The next time the setup utility is entered, the BMC self test on the Server Management tab should show as passed.
